

# DEvCon - Organise Endpoints Automatically

## DEvCon discovers risks

Benchmarking of locations according to free defined security criteria. Automated comparison of the as-is-state with the target state of standing instructions or the overall level of threat. Real-time inventory and monitoring of all used devices, applications, connected networks, exchanged or printed files... Real-time inventory of risks is the best basis for your risk-management or your first "hard" security policy.

## DEvCon lowers Costs

The Bavarian Police, for example, save over one million Euro annually through the automation provided with **DEvCon** on **21,000 work stations**.

## DEvCon automates

All events on a PC or Server are being detected in real-time. The central policies allow defining any reaction to any event - logging being just one of the possibilities. Informing the help-desk, alerting to the Security Officer, a security-awareness-dialogue with the user, self-approval with obligations and many other reaction possibilities represent the product's unlimited added values. The cascading architecture of **DEvCon** forwards information directly to the point of need or optionally calls an API of third-party-products.

## Drive Mapping

Collision-free assignment of drive letters - centrally and network-wide - no overlap with your network shares.

## DEvCon allows the real-time reaction to events on each single PC according to your definitions - even offline.

- Investigate network-connections according to predefined criteria - prior to usage of course
- Easy to configure user-notices and -dialogues e.g. for Security Awareness

- Electronic proof of conscience as evidence for the approval of the user for logging
- Virtual data-gates

...and much more at [www.itWatch.info](http://www.itWatch.info)

## Enhance Your Service quality using DEvCon

Security Awareness-Dialogues, Help Desk-Integration, Monitoring or completely automatized, predefined workflows - with DEvCon you realize the automatically secure process as Plug-In. An automatization of security-relevant processes in the rights-area of DEvCon is the key to success, e.g. when VIP-users don't have time to deal with the different technical details or when compliance regulations are too complicated to be easily communicated.

## Flexibility and Individuality

Event-driven and situation-based the active security policy can be changed in real-time, even when the PC is offline. The procedure for granting rights can be changed spontaneously. As a consequence security reflects the business, unplanned urgent situations, working hours at weekends and other individual requirements as well.

## Control Your Data Traffic

For all monitored events you determine, whether to just show the event in your real-time monitor, forward it or write it in any database of your choice. Forwarding means, you may provide all desired information to other **DEvCon** instances or third party products (such as Tivoli, IDS, Patrol, etc.).

## Data gates and self-approval ...

Self-approval combined with required consent to detailed logging significantly lowers administrative costs and fulfills the wishes of VIPs. User-dialogues can be easily adapted by the customer with great flexibility and many functional options. The integration in the Corporate Identity (company logo in the dialogues) results in high acceptance by the user. The local quarantine and the data-gate-solution help to establish secure and lean processes, provable compliance, user acceptance and cost-efficiency,
